Data management plan (DMP)

Beyond the Lab: How Practitioners Perceive Privacy Attack Risks in AI Systems

Beyond the Lab

Version	Effective date	Description of document/changes
1.0	23/06/2026	First version of the DMP – created for the start of the project
2.0	10/11/2026	Anonymised version prepared for peer review. Identifying information has been removed or replaced to preserve author anonymity.

Data Management Plan (DMP)

I General Information

I.1 Administrative information

DMP version: 2, 10.11.2026

Contributors:

Anonymous authors

I.2 Data management responsibilities and resources

Person responsible for data management and DMP: Anonymous authors

Co-ordination of data management responsibilities across partners: Anonymous authors

II Data Characteristics

II.1 Data description and collection or re-use of existing data

Produced datasets:

dataset ID	title	type	format	estimated volume	contains sensitive data	description
P1	Interview video recordings	Audiovisual data	MP4	5 - 20 GB	yes	Video recordings of semi-structured interviews conducted via Zoom on privacy risks in AI/ML systems.
P2	Interview transcripts and interview notes	Standard office documents	TXT	1 - 5 MB	yes	Transcripts and notes from semi-structured interviews on privacy risks in AI/ML systems.
P3	Interview summary table	Structured text	XLSX	Less than 1 MB	yes	Summaries of interview findings organised by participant and thematic category
P4	Participant metadata	Structured text	XLSX	Less than 1 MB	yes	Participant background information, including professional role and domain, organised by interview identifier.

Methods and software used for data generation and reuse

	The research data were collected through semi-structured interviews conducted via Zoom with participants from relevant professional domains. The interviews were video-recorded and transcribed. The recordings were used solely to check and correct the transcripts. The resulting research materials include interview recordings, transcripts, interview notes, and a structured interview summary tables. No existing external datasets were reused. Literature and methodological references informed the study design and analysis. The interview data were analysed qualitatively in MAXQDA using a combination of deductive and inductive coding. The transcripts were coded using an initial codebook informed by the research questions and interview guide, with additional codes developed during analysis. Interview findings were summarised by participant and thematic category, and the summary table was exported from MAXQDA in XLSX format. Standard office software was used to prepare interview guides, notes, and other study documentation.
III Documentation and Data Quality	
III.1 Metadata and documentation	**Data organisation, metadata, and documentation:** The research data are organised into separate folders by data type, including interview video recordings, transcripts and notes, coding and summary tables, and participant information. Identifying information is stored separately from the interview and analysis data. Interview transcripts are stored as plain-text files using the naming convention IntTran_XX_YYYYMMDD.txt, where XX identifies the interview and YYYYMMDD records the interview date. For example, IntTran_01_20260722.txt identifies the transcript of interview 01, conducted on 22 July 2026. Interview identifiers link the transcripts to the corresponding coding records and entries in the interview summary table. Data quality was supported by a consistent semi-structured interview guide and manual checking and correction of transcripts against the recordings. Qualitative coding was conducted in MAXQDA using a codebook that was refined during analysis. The interview summary table organises findings by participant and thematic category. The interview guide, codebook, and summary table document analysis process and support interpretation of the findings.
III.2 Data quality control	**Data quality control:** Data quality was supported by using a consistent semi-structured interview guide, manually checking and correcting transcripts against the recordings, and using a common codebook for qualitative coding. The codebook was refined during analysis to clarify coding categories and incorporate additional themes.
IV Data Storage and Sharing	

IV.1 Data storage during the research process	**Storage:** The research data are stored on an institutional server. These include P1 (interview video recordings), P2 (interview transcripts and notes), P4 (participant metadata), and P3 (interview summary table). The research team is responsible for managing the data and maintaining the DMP. **Data security and protection of sensitive data:** The research materials contain personal and potentially confidential information. Access is restricted to authorised project members through server permissions, as specified in the table below. Identifying information is stored separately from the interview and analysis data.
IV.2 Data sharing	**Data publication and access conditions:** During anonymous peer review, materials provided to reviewers will be shared through an anonymised repository. Author names, institutional affiliations, and other information identifying the research team will be omitted from these materials and their publicly visible metadata. Interview video recordings, full transcripts, interview notes, consent forms, and identifying participant information will remain restricted to authorised researchers. Materials selected for sharing will be checked for information that could identify participants or their organisations.
V Legal and Ethical Aspects	
V.1 Legal aspects	**Personal data:** The project involves processing personal data in P1 (interview video recordings), P2 (interview transcripts and notes), and P4 (participant metadata). P3 (interview summary table) may also contain indirectly identifying information derived from the interviews. Transcripts and analytical materials are pseudonymised by removing or replacing directly identifying information. As interview content may still permit indirect identification, these materials are treated as personal data unless sufficiently anonymised for public release. Access restrictions and separate storage of identifying information provide additional safeguards.

	Intellectual property rights and rights of use: Processing and sharing of the research data are subject to applicable data protection requirements, the conditions communicated to participants in the informed-consent materials, and confidentiality considerations arising from the interview content. These restrictions apply to datasets P1-P4. The project researchers manage access to the research data. Access to confidential materials is restricted to authorised researchers. Contact details, and any file linking participant identities to interview identifiers are stored separately from the pseudonymised research data, with access limited to researchers who require this information. Any public release of excerpts or derived materials will be limited to information that has been checked for identification risks and whose disclosure is consistent with the participant information and consent conditions.
V.2 Ethical aspects	**Ethical issues:** The study followed guidance provided by the institution's ethics committee. Participation was voluntary, and participants consented to the recording and transcription of their interviews. Recordings were used solely to check and correct the transcripts. Participant confidentiality was protected through pseudonymisation and restricted access to the research materials.
